## Outline of talk

## 2. Main result of this talk

## (3) Brief discussion of proof techniques

## Introduction

Basic notations and maximal shortest paths

## Basic notations

- $\operatorname{Nbr}(u)$ : set of neighbors of node $u$
- $u \stackrel{s}{\leftrightarrow} v$ : a shortest path between nodes $u$ and $v$
- $d_{u, v}$ : length (number of edges) of $u \stackrel{s}{\leftrightarrow} v$
- $\operatorname{diam}(G)=\max _{u, v}\left\{d_{u, v}\right\}$ : diameter of graph $G$

$\operatorname{Nbr}\left(u_{2}\right)=\left\{u_{1}, u_{4}, u_{5}\right\}$
$\boldsymbol{u}_{\mathbf{2}} \stackrel{s}{\leftrightarrow} \boldsymbol{u}_{\mathbf{6}}$ is the path $\boldsymbol{u}_{\mathbf{2}}-\boldsymbol{u}_{\mathbf{5}}-\boldsymbol{u}_{\mathbf{6}}$
$d_{u_{2}, u_{6}}=2$

## Introduction

Basic notations and maximal shortest paths

## Basic notations

- $\operatorname{Nbr}(u)$ : set of neighbors of node $u$
- $u \stackrel{s}{\leftrightarrow} v$ : a shortest path between nodes $u$ and $v$
- $d_{u, v}$ : length (number of edges) of $u \stackrel{s}{\leadsto} v$
- $\operatorname{diam}(G)=\max _{u, v}\left\{d_{u, v}\right\}$ : diameter of graph $G$

## Definition (maximal shortest path)

$u \stackrel{s}{\leftrightarrow} v$ is maximal if it is not properly included inside another shortest path

## Introduction

Basic notations and maximal shortest paths

## Definition (maximal shortest path)

$u \stackrel{s}{\leftrightarrow} v$ is maximal if it is not properly included inside another shortest path

## Introduction

Strong resolution

## Definition (node $x$ strongly resolves pair of nodes $u$ and $v$ )

$x \triangleright\{u, v\}$ if and only if
$\nu$ is on a shortest path between $x$ and $u \quad x_{\leftrightarrow}^{s} \stackrel{s}{\leadsto} \stackrel{s}{\leadsto} u \quad x=v$ is allowed or
$u$ is on a shortest path between $x$ and $v \quad x^{s} \stackrel{s}{\leftrightarrow} u \stackrel{s}{\leftrightarrow} v \quad x=u$ is allowed

## Introduction

Strong resolution

## Definition (node $x$ strongly resolves pair of nodes $u$ and $v$ )

 $x \triangleright\{u, v\}$ if and only if $\nu$ is on a shortest path between $x$ and $u \quad x_{\leftrightarrow}^{s} \underset{\sim}{s} \stackrel{s}{\sim} u \quad x=v$ is allowed or$u$ is on a shortest path between $x$ and $v \quad x^{s} \stackrel{s}{\leftrightarrow} u \stackrel{s}{\leftrightarrow} v \quad x=u$ is allowed

## Definition (strongly resolving set of nodes $V^{\prime}$ for $G$ )

 $V^{\prime} \triangleright G$ if and only ifsome node in $V^{\prime}$ strongly resolves every distinct pair of nodes of $G$

$$
\forall u, v \in V \exists x \in V^{\prime}: x \triangleright\{u, v\}
$$

## Introduction

Problem of computing strong metric dimension

## Problem of computing strong metric dimension

Problem name
Instance undirected graph $G=(V, E)$
Valid Solution set of nodes $V^{\prime}$ such that $V^{\prime} \triangleright G$ Objective minimize $\left|V^{\prime}\right|$

$$
\begin{gathered}
\text { Related notation } \\
\operatorname{sdim}(G)=\min _{V^{\prime} \triangleright G}\left\{\left|V^{\prime}\right|\right\}
\end{gathered}
$$

## Introduction

Problem of computing strong metric dimension

## Problem of computing strong metric dimension

Problem name
Instance undirected graph $G=(V, E)$
Valid Solution set of nodes $V^{\prime}$ such that $V^{\prime} \triangleright G$ Objective minimize $\left|V^{\prime}\right|$

## Related notation

$$
\operatorname{sdim}(G)=\min _{V^{\prime} \triangleright G}\left\{\left|V^{\prime}\right|\right\}
$$

Example (Illustration of STR-MET-DIM)

$$
\begin{aligned}
& V^{\prime}=\left\{u_{1}, u_{2}, u_{3}\right\} \\
& \operatorname{sdim}(G)=3
\end{aligned}
$$

## Introduction

Basic concepts related to approximation algorithms

Basic concepts related to approximation algorithms e.g., see V. Vazirani, Approximation Algorithms, Springer-Verlag, 2001

## Minimization problem

Definition ( $\rho$-approximation algorithm (algorithm with approximation ratio $\rho$ ))

- runs in time polynomial in size of input
- produces solution with value $\leq \rho$ OPT
optimum value

## Main result of this talk

## Theorem (Optimal approximability results for STR-MET-DIM)

- STR-MET-DIM admits a polynomial-time 2-approximation algorithm
- Assuming that the unique games conjecture ${ }^{a}$ is true, Str-MET-DIM does not admit a polynomial-time ( $2-\varepsilon$ )-approximation for any constant $\varepsilon>0$ even if the given graph $G$ satisfies
- $\operatorname{diam}(G) \leq 2$, or
- $G$ is bipartite and $\operatorname{diam}(G) \leq 4$

Brief discussion of proof techniques

## Boolean satisfiability problem (SAT)

```
Problem name SAT
    Instance - n Boolean variables }\mp@subsup{x}{1}{},\mp@subsup{x}{2}{},\ldots,\mp@subsup{x}{n}{
    - m clauses C1, C2,\ldots,Cm}\mathrm{ over these variables
    \
    each clause is OR of some literals
        \lambda
    literal is variable or negation of variable
```

Decision question is $\Phi \stackrel{\text { def }}{=} C_{1} \wedge C_{2} \wedge \cdots \wedge C_{m}$ satisfiable ? can we set the variables such that $\Phi$ is true ?

## Introduction

Brief discussion of proof techniques

## Boolean satisfiability problem (SAT)

## Problem name SAT

Instance - $n$ Boolean variables $x_{1}, x_{2}, \ldots, x_{n}$

- $m$ clauses $C_{1}, C_{2}, \ldots, C_{m}$ over these variables

1
each clause is OR of some literals
$\lambda$
literal is variable or negation of variable
Decision question is $\Phi \stackrel{\text { def }}{=} C_{1} \wedge C_{2} \wedge \cdots \wedge C_{m}$ satisfiable ? can we set the variables such that $\Phi$ is true ?

## Example (Illustration of SAT)

variables

$$
\begin{aligned}
\text { es } & x_{1}, x_{2}, x_{3}, x_{4} \\
\Phi= & \left(\neg x_{1} \vee x_{2}\right) \wedge\left(\underset{c_{1}}{\left(x_{1} \vee \neg x_{3} \vee x_{4}\right) \wedge\left(\underset{c_{2}}{x_{3}}\right)}\right.
\end{aligned}
$$

$\Phi$ is satisfiable

$$
x_{1}=x_{2}=x_{3}=x_{4}=\mathrm{TRUE}
$$

## Introduction

Brief discussion of proof techniques

## Brief discussion of proof techniques

Fact (S. Khot and O. Regev, Vertex cover might be hard to approximate to within 2- $\varepsilon$, Journal of Computer and System Sciences, 74(3), 335-349, 2008)
$\delta>0$ any arbitrarily small constant assume unique games conjecture is true

## Instance $\Phi$ of SAT

## Instance (graph) $G$ of MNC with $n$ nodes

$\Phi$ is satisfiable
$\Phi$ is NOT satisfiable

## Introduction

Brief discussion of proof techniques
Brief discussion of proof techniques for the result
Assuming that the unique games conjecture is true Str-MET-DIM does not admit a polynomial-time ( $2-\varepsilon$ )-approximation even if $\operatorname{diam}(G) \leq 2$, or even if $G$ is bipartite and $\operatorname{diam}(G) \leq 4$
$\delta>0$ any arbitrarily small constant
assume unique games conjecture is true

Instance $\Phi$ of SAT Graph $G$ of MNC with $n$ nodes
$\Phi$ is satisfiable $\longrightarrow \operatorname{MNC}(G) \leq\left(\frac{1}{2}+\delta\right) n \longrightarrow \operatorname{sdim}(\tilde{G})<\left(\frac{1}{2}+\delta\right) n+\log _{2} n+1$

$$
