and David Liben-Nowell - Carleton College

### Universal Generalization

valid rule 
$$\frac{A \rightarrow R(c)}{A \rightarrow \forall x.R(x)}$$

providing  $c$  is independent of  $A$

e.g. given any number  $c$ ,  $2c$  is an even number

$\Rightarrow$  for all  $x$ ,  $2x$  is an even number.

### Vacuous quantification

$$\forall x \in \emptyset \quad P(x)$$

All even prime numbers greater than 5 have 3 as the last digit

**Vacuously true**

### Not Valid

$$\forall z [Q(z) \vee P(z)] \rightarrow [\forall x.Q(x) \vee \forall y.P(y)]$$

*Proof:* Give **counterexample**, where  $\forall z [Q(z) \vee P(z)]$  is **true**, but  $\forall x.Q(x) \vee \forall y.P(y)$  is **false**.

Find a domain, and a predicate.

In this example, let domain be integers,  
 $Q(z)$  be true if  $z$  is an even number, i.e.  $Q(z)=\text{even}(z)$   
 $P(z)$  be true if  $z$  is an odd number, i.e.  $P(z)=\text{odd}(z)$

Then  $\forall z [Q(z) \vee P(z)]$  is true, because every number is either even or odd.  
 But  $\forall x.Q(x)$  is not true, since not every number is an even number.  
 Similarly  $\forall y.P(y)$  is not true, and so  $\forall x.Q(x) \vee \forall y.P(y)$  is not true.

### Mathematical Proof

We prove mathematical statement by using logic.

$$\frac{P \rightarrow Q, Q \rightarrow R, R \rightarrow P}{P \wedge Q \wedge R} \quad \text{not valid}$$

To prove something is true, we need to assume some **axioms!**

This is invented by Euclid in 300 BC, who begins with 5 assumptions about geometry, and derive many theorems as logical consequences.

[http://en.wikipedia.org/wiki/Euclidean\\_geometry](http://en.wikipedia.org/wiki/Euclidean_geometry)

(see [http://en.wikipedia.org/wiki/Zermelo-Fraenkel\\_set\\_theory](http://en.wikipedia.org/wiki/Zermelo-Fraenkel_set_theory) for the ZFC axioms for set theory)

### Basic Definitions

An integer  $n$  is an **even** number  
if there exists an integer  $k$  such that  $n = 2k$ .

An integer  $n$  is an **odd** number  
if there exists an integer  $k$  such that  $n = 2k+1$ .

### Proving an Implication

**Goal:** If  $P$ , then  $Q$ . ( $P$  implies  $Q$ )

**Method 1:** Write assume  $P$ , then show that  $Q$  logically follows.

**Claim:** If  $0 \leq x \leq 2$ , then  $-x^3 + 4x + 1 > 0$

**Reasoning:** When  $x=0$ , it is true.  
When  $x$  grows,  $4x$  grows faster than  $x^3$  in that range.

**Proof:**  $-x^3 + 4x + 1 = x(2-x)(2+x) + 1$   
When  $0 \leq x \leq 2$ ,  $x(2-x)(2+x) \geq 0 \quad \square$

### Direct Proofs

The sum of two even numbers is even.

**Proof**  $x = 2m, y = 2n$   
 $x+y = 2m+2n$   
 $= 2(m+n)$

The product of two odd numbers is odd.

**Proof**  $x = 2m+1, y = 2n+1$   
 $xy = (2m+1)(2n+1)$   
 $= 4mn + 2m + 2n + 1$   
 $= 2(2mn+m+n) + 1.$

### Divisibility

$a$  "divides"  $b$  ( $a|b$ ):  
 $b = ak$  for some integer  $k$

$5|15$  because  $15 = 3 \times 5$

$n|0$  because  $0 = n \times 0$

$1|n$  because  $n = 1 \times n$

$n|n$  because  $n = n \times 1$

A number  $p > 1$  with no positive integer divisors other than 1 and itself is called a **prime**. Every other number greater than 1 is called **composite**.

2, 3, 5, 7, 11, and 13 are prime,  
 4, 6, 8, and 9 are composite.

### Simple Divisibility Facts

1. If  $a | b$ , then  $a | bc$  for all  $c$ .
2. If  $a | b$  and  $b | c$ , then  $a | c$ .
3. If  $a | b$  and  $a | c$ , then  $a | sb + tc$  for all  $s$  and  $t$ .
4. For all  $c \neq 0$ ,  $a | b$  if and only if  $ca | cb$ .

Proof of (1)

$$a | b$$

$$\Rightarrow b = ak$$

$$\Rightarrow bc = ack$$

$$\Rightarrow bc = a(ck)$$

$$\Rightarrow a | bc$$

$a$  "divides"  $b$  ( $a|b$ ):  
 $b = ak$  for some integer  $k$

### Simple Divisibility Facts

1. If  $a | b$ , then  $a | bc$  for all  $c$ .
2. If  $a | b$  and  $b | c$ , then  $a | c$ .
3. If  $a | b$  and  $a | c$ , then  $a | sb + tc$  for all  $s$  and  $t$ .
4. For all  $c \neq 0$ ,  $a | b$  if and only if  $ca | cb$ .

Proof of (2)

$$a | b \Rightarrow b = ak_1$$

$$b | c \Rightarrow c = bk_2$$

$$\Rightarrow c = ak_1k_2$$

$$\Rightarrow a | c$$

$a$  "divides"  $b$  ( $a|b$ ):  
 $b = ak$  for some integer  $k$

### Simple Divisibility Facts

1. If  $a | b$ , then  $a | bc$  for all  $c$ .
2. If  $a | b$  and  $b | c$ , then  $a | c$ .
3. If  $a | b$  and  $a | c$ , then  $a | sb + tc$  for all  $s$  and  $t$ .
4. For all  $c \neq 0$ ,  $a | b$  if and only if  $ca | cb$ .

Proof of (3)

$$a | b \Rightarrow b = ak_1$$

$$a | c \Rightarrow c = ak_2$$

$$sb + tc$$

$$= sak_1 + tak_2$$

$$= a(sk_1 + tk_2)$$

$$\Rightarrow a | (sb+tc)$$

$a$  "divides"  $b$  ( $a|b$ ):  
 $b = ak$  for some integer  $k$

### Proving an "if and only if"

**Goal:** Prove that two statements P and Q are "logically equivalent", that is, one holds if and only if the other holds.

**Example:**

An integer is even if and only if the its square is even.

**Method 1:** Prove P implies Q and Q implies P.

**Method 1':** Prove P implies Q and not P implies not Q.

**Method 2:** Construct a chain of if and only if statement.

### Proof the Contrapositive

An integer is even if and only if the its square is even.

**Method 1:** Prove P implies Q and Q implies P.

**Statement:** If m is even, then  $m^2$  is even

**Proof:**  $m = 2k$

$$m^2 = 4k^2$$

**Statement:** If  $m^2$  is even, then m is even

**Proof:**  $m^2 = 2k$

$$m = \sqrt{2k}$$

??

### Proof the Contrapositive

An integer is even if and only if the its square is even.

**Method 1':** Prove P implies Q and not P implies not Q.

**Statement:** If  $m^2$  is even, then m is even

**Contrapositive:** If m is odd, then  $m^2$  is odd.

**Proof (the contrapositive):**

Since m is an odd number,  $m = 2k+1$  for some integer k.

$$\text{So } m^2 = (2k+1)^2$$

$$= (2k)^2 + 2(2k) + 1$$

So  $m^2$  is an odd number.
