"MATHEMATICS IS THE ART OF GIVING THE SAME NAME TO DIFFERENT THINGS."
JULES HENRI POINCARÉ (1854-1912)

Seven Bridges of Königsberg

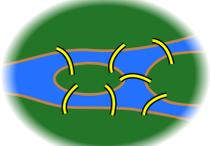

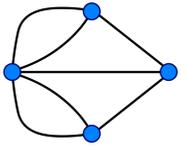

Leonard Euler
1707-1783

Is it possible to walk with a route that crosses each bridge

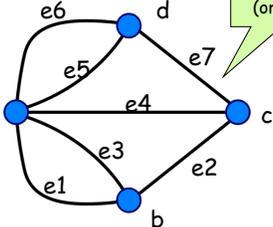

Seven Bridges of Königsberg

→

→

Forget unimportant details. Forget even more.

A Graph

A vertex
(or a node,
or a point)

An edge
(or a line)

So, what is the "Seven Bridges of Königsberg" problem?

To find a walk that visits each edge exactly once.

Euler's Solution

Question: Is it possible to find a walk that visits each edge

Suppose there is such a walk, there is a starting point and an

For every "intermediate" point v , there must be the same number of incoming and outgoing edges, and so v must have an **even number**

Euler's Solution

Question: Is it possible to find a walk that visits each edge

Suppose there is such a walk, there is a starting point and an

For every "intermediate" point v , there must be the same number of incoming and outgoing edges, and so v must have an **even number**

So, at most **two** vertices can have odd number of edges.

In this graph, every vertex has only an odd number of edges, and so there is no walk which visits each edge exactly one.

Euler's Solution

So Euler showed that the "Seven Bridges of Königsberg" is

When is it possible to have a walk that visits every edge exactly once?

Is it always possible to find such a walk if there is at most two vertices with odd number of edges?

Euler's Solution

So Euler showed that the "Seven Bridges of Königsberg" is

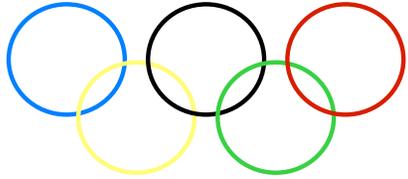

When is it possible to have a walk that visits every edge exactly once?

Is it always possible to find such a walk if there is at most two vertices with odd number of edges? **NO!**

Euler's Solution

So Euler showed that the "Seven Bridges of Königsberg" is impossible to solve.

When is it possible to have a walk that visits every edge exactly once?

Is it always possible to find such a walk if the graph is connected and there are **at most two** vertices with odd number of edges? **YES!**

Euler's Solution

So Euler showed that the "Seven Bridges of Königsberg" is impossible to solve.

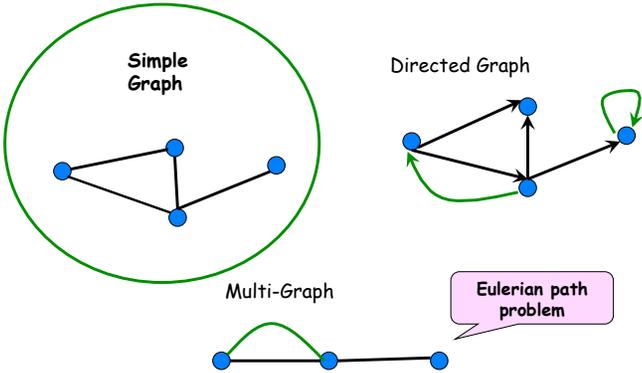

When is it possible to have a walk that visits every edge exactly once?

Eulerian path

Euler's theorem: A graph has an Eulerian path if and only if it is connected and has at most two vertices with an odd number of edges.

This theorem was proved in 1736, and was regarded as the starting point of graph theory.

Types of Graphs

Simple Graph

Directed Graph

Multi-Graph

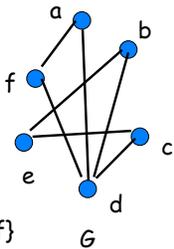

Eulerian path problem

Simple Graphs

A graph $G=(V,E)$ consists of:

- A set of vertices, V
- A set of undirected edges, E

- $V(G) = \{a,b,c,d,e,f\}$
- $E(G) = \{ad,af,bd,be,cd,ce,df\}$

Two vertices a,b are **adjacent (neighbours)** if the edge ab exists.

Vertex Degrees

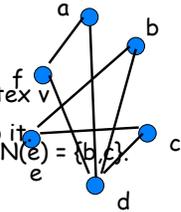

An edge uv is **incident** on the vertex u and the vertex v .

The **neighbour set** $N(v)$ of a vertex v is the set of vertices adjacent to it.
 e.g. $N(a) = \{d, f\}$, $N(d) = \{a, b, c, f\}$, $N(e) = \{b, c\}$.

degree of a vertex = # of **incident** edges

e.g. $\text{deg}(d) = 4$, $\text{deg}(a) = \text{deg}(b) = \text{deg}(c) = \text{deg}(e) = \text{deg}(f) = 2$.

the degree of a vertex $v =$ the number of neighbours of v .
 For multigraphs, **NO**. For simple graphs, **YES**.

Degree Sequence

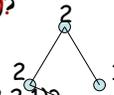

Is there a graph with degree sequence $(2, 2, 2)$? **YES**

Is there a graph with degree sequence $(3, 3, 3, 3)$? **YES**

Is there a graph with degree sequence $(2, 2, 1, 1)$? **NO**

Is there a graph with degree sequence $(2, 2, 2, 2, 1)$? **NO**

NO. What's wrong with these sequences?

Where to go?

Handshaking Lemma

For any graph, sum of degrees = twice # edges

Lemma. $2|E| = \sum_{v \in V} \text{deg}(v)$

- Corollary.
1. Sum of degree is an even number.
 2. Number of odd degree vertices is even.

Examples. $2+2+1 = \text{odd}$, so impossible.
 $2+2+2+2+1 = \text{odd}$, so impossible.

Handshaking Lemma

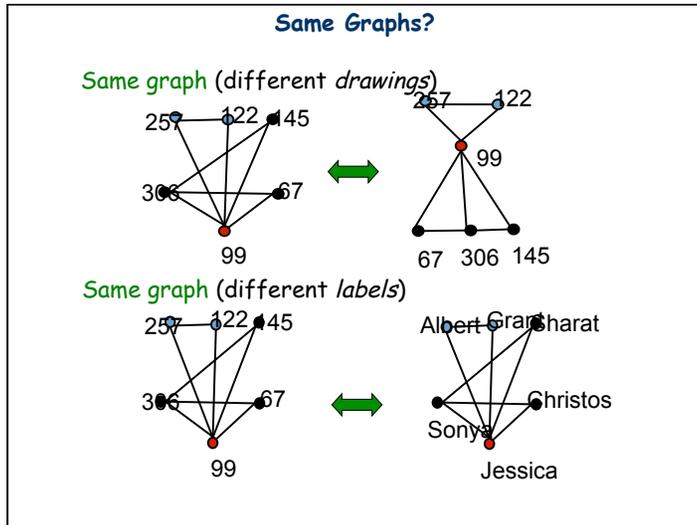

Lemma. $2|E| = \sum_{v \in V} \text{deg}(v)$

Proof. Each edge contributes 2 to the sum on the right.

Question. Given a degree sequence, if the sum of degrees is even, is it true that there is a graph with such a degree sequence?

For simple graphs, **NO**, consider the degree sequence $(3, 3, 3, 3)$

For multigraphs (with self loops), **YES!** (easy by induction)

Graph Isomorphism

All that matters is the *connections*.

Graphs with the same connections are

Informally, two graphs are isomorphic if they are the same structure.

G_1 isomorphic to G_2 means there is an edge-preserving vertex matching.

relation preserving

renaming function

Graph isomorphism has applications like checking fingerprint, etc.
